I WOKE UP THIS MORNING AND I’D COME ALL OVER THE SHEETS. WHAT IF MY MUM SEES IT?

WHAT’S THE HORRIBLE SMELLY STUFF UNDER MY FORESKIN?

REAL MEN DON’T WANK... DO THEY?

WHY HAVE I ALWAYS GOT THIS BULGE IN MY TROUSERS?

I’VE ONLY GOT A LITTLE WILLY

I’VE GOT TO GET LAID... I FEEL LIKE I’M GOING TO BURST!

CAN YOU MAKE YOUR PENIS BIGGER?
Changes in Your Body

Sexual development can happen at any time between eight and 18, but usually begins around 11 or 12. It makes no difference when you start. It doesn’t affect what you’ll be like as an adult.

These are some of the more obvious changes. But there are others, emotional as well as physical . . .
Normally a man’s penis is soft and hangs down. But when he gets sexually excited (and often when he's not aware of it), he gets an **erection**:

- the penis goes **stiff**
- it grows **longer** and **wider**
- it sticks **outwards** and **upwards** from the body.

A penis is used for two jobs, peeing and sex. When your penis is erect you can’t pee easily because a muscle closes the bladder off. The shape of an erect penis varies. It usually curves upwards slightly, and may point to one side. Erections (hard-ons, boners, stiffies) occur in males of all ages, including babies and old men.

**ERECITIONS ARE UNRELIABLE**

Erections can come and go without warning. They can happen at a moment’s notice, sometimes in embarrassing circumstances. And they can vanish just as easily. Alcohol can cause an erection to droop. So can fear of pregnancy, being laughed at, or of coming too soon (premature ejaculation).
Many young men think that their penis is smaller than anyone else’s. This is unlikely. Adult penis sizes do vary, but not by as much as you might think. The soft penis usually shrinks when it's cold or when the man is anxious. As a rough rule, the larger a penis is when soft, the less it grows when hard. If it is small when soft, it will probably grow more when hard.

Penis size varies but not by very much.

When penises are erect they are very similar in size for all men.

Nothing will make a penis any larger or smaller.

Your own penis will look smaller to you than to others because you are looking down at it.

It will look larger in a full-length mirror.
The **foreskin** is a sleeve of skin that surrounds the head of the penis. When you get an erection, the foreskin stretches. The head of the penis is then completely exposed.

If you don't wash under the foreskin, a yellowish-white creamy substance called **smegma** builds up. This is normal. But if you don't want to smell like a mouldy cheese, wash it every day.

If you have a tight foreskin, you could try to ease it back.

While you are soaking in the bath, gently pull the foreskin away from you. **Pull it back and hold it in a stretched position, briefly.**

This may gradually stretch the foreskin. If there seems to be a problem, talk to your doctor.

In some cases, the foreskin can be so tight your doctor may advise using a special cream or having a small operation to loosen the foreskin.

Complete removal of the foreskin is called **circumcision**.

Some men are circumcised, often for religious reasons. For example, most Jewish and Muslim boys are circumcised in childhood. It makes no difference to a man’s ability to urinate (pee) or ejaculate (come).
Men have two testicles (balls, testes, bollocks, nuts, nads) hanging in a bag (scrotum) outside the body, just behind the penis.

The balls produce tiny, tadpole-shaped sperm that fertilise a woman’s egg to make a baby.

The balls are connected to the penis by a long, thin tube called the vas deferens.

Sperm are stored in the epididymis, then are passed along the vas deferens to the prostate gland. Here they mix with fluid to make semen. Both semen and pee from the bladder pass down a tube through the penis. This tube is called the urethra and it runs to the tip of the penis.

Each testicle is roughly the size of a small plum.

Balls should be about the same weight and size.

One ball (usually the left) often hangs a little lower than the other. This is so they don’t bash into each other when you run.
**Facts about your scrotum**

Your balls hang in a soft bag of skin – the scrotum. It hangs outside the body because sperm need to be kept cooler than your internal body temperature of 37°C to be able to fertilise an egg. Sperm are damaged or killed by heat.

The scrotum is usually darker in colour than the rest of the skin, and hairy.

When it’s cold, the scrotum puckers up and becomes very wrinkled.

When it is warm, the balls hang loose, and the surface of the scrotum is smooth.

**Take good care of your balls**

Spots, bumps and moles are common on the scrotum and penis, and don’t usually mean anything.

If you play a sport where a blow, boot, or ball could damage your testicles, wear a plastic protector, or box.

**Testicular cancer** (cancer of the balls) most commonly affects teenagers and young men. This makes it different from most other cancers, which mainly affect older people.

Almost all cancers of the testicles can be cured if detected early enough – that’s why you should examine yourself every month.

See your doctor if lumps and bumps suddenly appear on or in your balls.
How to EXAMINE YOURSELF

A relaxing warm bath or shower makes examination easier.

It’s easier to check for lumps and bumps when you’re standing up and gravity makes your balls hang down. Stand in front of a mirror to look for any swelling or change in size. One ball (usually the left) may hang slightly lower than the other.

Feel each ball in turn. Use both hands. With your thumb on top and your index finger beneath, gently roll the ball. You will find a hard sausage-shaped ridge on top of the ball. This is normal (it’s called the epididymis, where sperm are stored).

‘Weigh’ each ball in your cupped hand. One ball should not be heavier than the other.

Testicular cancer doesn’t happen very often and it can usually be cured. Most lumps and bumps will not be cancers, but one might be. If you have any warning signs, talk to your doctor.
Facts about Masturbation

Most boys and men rub themselves to get an erection and to have an orgasm (come). Masturbation (wanking, jerking off) can start at any age, though it can’t lead to ejaculation until you reach puberty.

Is it bad for you?

It’s completely harmless, no matter how you do it, or how often. It won’t make you go blind or mad, and you won’t get hairs on the palms of your hand. Several times a day is not unusual, nor is less often. It helps you to know your body better, and what you like and don’t like. But you don’t have to do it.

Fantasies while masturbating? Everyone has them.

Is it ok to masturbate before an exam or a hard sport?

There is no way you can ‘lose energy’ this way. A few sportsmen won’t masturbate or have sex the night before a match. Others take the opposite view. There’s no scientific evidence against masturbation.

Wet dreams Most young men will sometime or other wake to find they have come in the bed. It may be embarrassing to mess the sheets, but it’s completely normal. If you’re anxious, wear pants.
What about EJACULATION?

Most young men ejaculate (come, have an orgasm) for the first time around the start of puberty. It takes some by surprise. Others work at it.

So what happens? Sexual excitement causes muscles at the base of the penis to contract hard and semen to spurt out.

During a man's orgasm, he has rapid, rhythmical contractions which can last for several seconds and are highly pleasurable.

Sometimes ejaculation may pump semen quite a distance. At other times, it just dribbles out. Semen may be thick and almost yellow. Or thin and watery.

Sperm swim in a milky liquid called SEMEN (spunk, come).

Can you run out of sperm? No. It takes around 80 days for a sperm to be produced, but the production is a continuous process, so there are always plenty of fully mature sperm at any time.

When a man comes, he squirts out on average a teaspoonful of semen containing millions of sperm.

A drop of semen about this size contains thousands of sperm.

How often can a man ejaculate? It varies. Some young men can ejaculate several times a day, others less often.
**When is the right time to have sex?**

There is no ‘right age’. If you believed everything you read or heard, you’d think that every young person was ‘doing it’. It’s not true. The average age when both men and women first have sex is 16. Many wait until they are older. If you have any doubts, or think that you’ll regret it, then wait.

**I want to have sex, but my partner doesn’t...**

Putting pressure on someone to have sex could ruin what could have been a beautiful relationship. And you don’t have to have sex with everyone you go out with. Besides, there’s so much more to sex than intercourse.

There are many sexual activities that don’t involve penetration, but they do give pleasure.

**I think I’m gay ...**

If you are gay, that’s ok – lots of people are gay.

Getting an erection when you’re around other boys doesn’t necessarily mean that you’re gay. But you may be interested in other men – or men and women. If you want advice, contact the organisations on the back page.

**How can we protect ourselves?**

Condoms (male and female) can help protect you and your partner against both infection and pregnancy. But there are other ways of preventing pregnancy.

Except for the male condom and male sterilisation, all other methods of contraception are used by women.

But that doesn’t mean that contraception is a woman’s business. It’s as much your responsibility.

To find out more, visit www.fpa.org.uk.

**We think the time’s right ...**

If you and your partner both feel ready to have sex, it’s a good idea to prepare for your first time together.

This doesn't just mean thinking about where and when – it means protecting yourselves against the possibility of unplanned pregnancy and sexually transmitted infections.

Talk about it together, and get protection sorted before you have sex.

**Sex and the law**

It’s against the law for anyone to have sex with a young person under the age of 16.

This is known as the age of consent and is the same for everyone, whatever your gender or sexual orientation.
A male condom (johnny, rubber) is a thin latex (rubber) or polyurethane (plastic) tube made to fit tightly over a man’s hard penis. It catches the sperm when they come out.

**Use a condom:**
- If you don’t want to be a Dad
- If your girlfriend doesn’t want to be a Mum
- If you don’t want to get (or pass on) a sexually transmitted infection (STI) such as chlamydia, gonorrhoea, or HIV. Condoms (male and female) are FREE from young people’s services, contraception and sexual health clinics, and some genitourinary medicine (GUM) clinics and general practices, or you can buy them from supermarkets, pharmacies, garages or vending machines. Visit www.fpa.org.uk for more information about STIs.

Never use oil-based products, such as moisturising oils or body lotions, with a latex condom as they can damage it and make it more likely to split.

Use a water-based lubricant (lube) with latex condoms. Any lubricant can be used with polyurethane condoms.

Get your own condoms. Don’t wait for your partner to ask you to use a condom. Don’t leave it to your partner to have a condom (but don’t assume they sleep around if they do). Talk to your partner about using condoms.

Both ready and willing?

Check that your condom isn’t past its use-by date. Always use a new one when you have sex.

Some men say they don’t want to use condoms . . .

. . . because they’re not sure how to put them on.

No excuses:

Instructions are inside every new condom packet. Practise with condoms before you use them for real.
If the condom slips off or splits, tell your partner. Women can get emergency contraception from their doctor or a contraception or sexual health clinic, some GUM clinics and pharmacies. There are three types of emergency contraception. An emergency IUD (intrauterine device) can be fitted in the uterus (womb) within five days of sex or ovulation (release of an egg). A pill with ulipristal acetate must be taken up to five days (120 hours) after sex. A pill with levonorgestrel must be taken up to three days (72 hours) after sex. Both pills are more effective the earlier they’re taken.

If you have sex without a condom or if the condom slips off or splits, you should get tested for STIs. You can do this at a young people’s clinic, a sexual health centre, or a GUM clinic. Visit www.fpa.org.uk for further information.
For information on sexual health, sex and relationships visit www.fpa.org.uk or check out these FPA booklets.

These organisations can also give you confidential information and advice.

**BROOK**
www.brook.org.uk
For sexual health services and advice for young people.

**CHILDLINE**
0800 1111
www.childline.org.uk
24-hour helpline for young people with any problem.

**BEAT**
www.b-eat.co.uk
Support for people affected by eating disorders.

**FRANK**
www.talktofrank.com
For information on drugs.

**RAPE CRISIS**
www.rapecrisis.org.uk
For girls and women who have been raped or assaulted recently or in the past.

**SURVIVORS UK**
www.survivorsuk.org
For boys and men who've been raped or sexually abused.

**SWITCHBOARD**
– the LGBT+ helpline
www.switchboard.lgbt
Support and information for gay men, lesbians, and bisexual and trans people.

**THE MIX**
www.themix.org.uk
0808 808 4994
Free, confidential helpline and advice service for young people.
